

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Claims 1 through 13 (canceled)

Claim 14 (new): A connecting device comprising:

a bendable member which has enough restoring force and rigidity to restore a bent state to an unbent state and foldably connects two housing portions separated from each other by a predetermined distance;

wherein the bendable member is a thin plate having an arc shape in sectional view.

Claim 15 (new): A connecting device comprising:

a joint members having flexibility on which two housing portions are fixed at a predetermined gap; and

a bendable member which has enough restoring force and rigidity to restore a bent state to an unbent state and is attached to the two housing portions so as to be overlapped with the two housing portions.

Claim 16 (new): The connecting device according to claim 14,

wherein the bendable member is attached to the two housing portions, with a concave portion thereof oriented in a direction where the two housing portions are folded.

Claim 17 (new): The connecting device according to claim 15,

wherein the bendable member is mounted to the two housing portions, with a concave portion thereof oriented in a direction where the two housing portions are folded.

Claim 18 (new): The connecting device according to claim 15,

wherein the joint members has a folding force generating means for generating folding force to hold the folded state of the housing portions at a substantially central region thereof corresponding to the gap between the two housing portions.

Claim 19 (new): The connecting device according claim 15,

wherein the joint members includes a stopper that is bent to temporarily hold the folded state of the two housing portions.

Claim 20 (new): A connecting device comprising:  
a connecting portion which foldably connects two housing portions;  
a flexible wiring member which connects the two housing portions such that they can communicate with each other; and  
a receiving antenna which is connected to one of the two housing portions.

Claim 21 (new): An electronic apparatus comprising:  
two housing portions; and  
the connecting device according to claim 14 that foldably connects the two housing portions.

Claim 22 (new): The electronic apparatus according to claim 20, further comprising;  
a display unit that is provided in one of the two housing portions; and  
an operating unit that is provided in the other housing portion,  
wherein, when the two housing portions are in a folded state, the display unit and the operating unit are arranged opposite to each other.

Claim 23 (new): The electronic apparatus according to claim 20,

wherein the bendable member has a curved shape in sectional view,

both ends of the bendable member in the longitudinal direction are fixed to leading ends of bosses provided on the two housing portions, and

the leading ends of the bosses have spherical shapes.

Claim 24 (new): The electronic apparatus according to claim 20,

wherein the bendable member has a curved shape in sectional view,

both ends of the bendable member in the longitudinal direction are fixed to leading ends of bosses provided on the two housing portions, and

the leading ends of the bosses each have R portions opposite to each other.

Claim 25 (new): A folding portable terminal apparatus comprising:

an upper housing portion which has a display unit provided therein;

a lower housing portion which has an operating unit provided therein; and

a connecting portion which foldably connects the upper housing portion and the lower housing portion,

wherein the connecting portion includes a plurality of connecting plates each having a curved portion that is curved on an axis parallel to a connecting direction thereof.

Claim 26 (new): The folding portable terminal apparatus according to claim 14,

wherein the plurality of connecting plates overlap each other.
